Product models & symbols library

We offer files in the following file formats: CET by Configura, Revit, Sketchup, AutoCAD 2D & 3D, and Microsoft 3D Viewer. We regularly add new files to this library, so if a product file you're interest isn't available, keep checking back.

Assembly instructions and product specifications can be found in the Instructions and Specs sections of each product page.

Standing desks

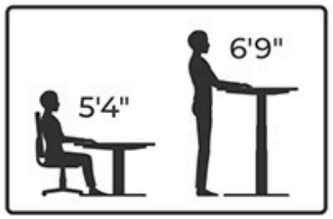
Which desk frame is right for me?

The key difference between the UPLIFT V2 and UPLIFT V2-Commercial is the height range, the V2-Commercial frame travels 3" lower than the V2 and is a great choice for shorter people. The V2-Commercial frame was developed to satisfy all requirements of the ANSI/BIFMA G1-2013 height standard to ergonomically accommodate 95% of office workers (people between 5' and 6'3" tall).

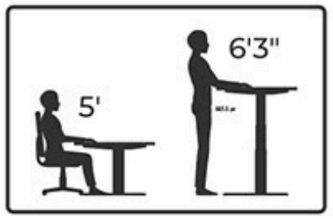


UPLIFT **V2** Desk Frame

- Height range with a 1" thick desktop: 25.3" to 50.9"
- Travel range: 25.6"
- User height range: Works for most people 5'4" to 6'9" tall

The stability braces at the top of each V2 desk leg maximize stoutness and eliminate side-to-side wobble to match the stability of the V2-Commercial desk without the need for a crossbar.

4'8" tall or less?



Meets ANSI/BIFMA
G1-2013 Height Standard

UPLIFT **V2-Commercial** Desk Frame

- Height range with a 1" thick desktop: 22.6" to 48.7"
- Travel range: 26.1"
- User height range: Works for most people 5' to 6'3" tall

The V2-Commercial desk has a 3" lower starting height and a ½" larger overall height adjustment range than the V2 frame. The legs are thicker and connected by a lower crossbar.

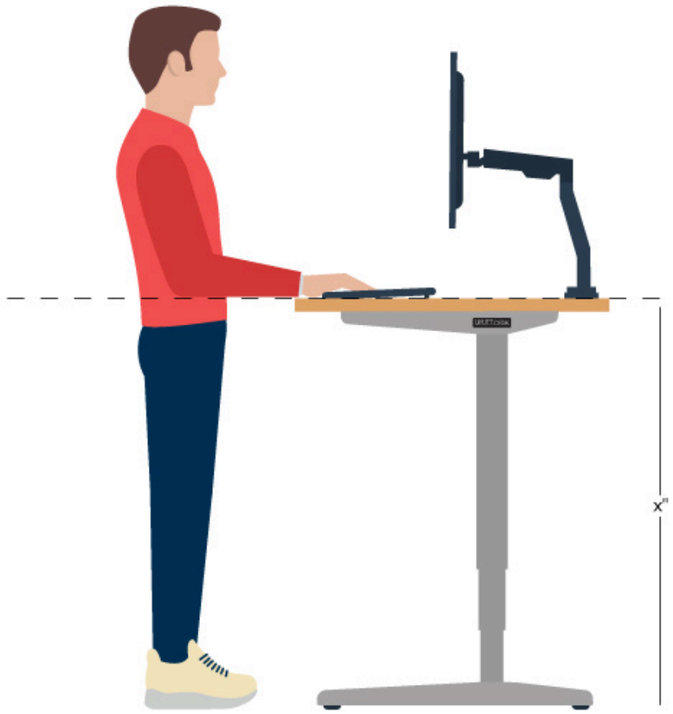
Between 4'8" & 6'9" tall?

Choose the V2-Commercial desk and consider a keyboard tray to decrease the seated desktop working height by up to 5".

Choose either the V2 or V2-Commercial desk, and if less than 5 feet tall, consider a keyboard tray to decrease the seated desktop working height by up to 5".

Measure your working heights

We recommend measuring your standing and seated working heights to ensure you select the best desk.



How to measure your standing height

Stand and measure from the floor to your 90° bent elbow. If your standing height is above 48.7", we recommend choosing the V2 desk frame. If you're using a treadmill or motion board, factor that into your height.

How to measure your seated height

Sit and measure from the floor to your 90° bent elbow. If your seated height is below 25.3", we recommend choosing the V2-Commercial desk frame.

Factors that affect height

- Shoes add about 1" to your standing height.
- Standing motion boards raise your height 2" or more.
- Casters raise desk height 2"–5", depending on the wheel model.
- Keyboard trays lower the ergonomic working position of your desk by up to 5", making the V2 desk suitable for users 4'8" and taller, and the V2-Commercial desk for users 4'3" and taller.
- Certain keyboard trays can raise the working position by up to 3" without a track spacer (or 1" with one), making the V2 desk ideal for users up to 7'0" tall

and the V2-Commercial desk for those up to 6'6".

C-frame vs T-frame

Both the C-frame and T-frame styles are equally rock solid.

C-Frame style

The C-Frame Style is the most popular. It's designed with the legs and frame body offset to the rear. Benefits include additional space for under-desktop mounted accessories like drawers, storage cubbies, keyboard trays, CPU holders, and more leg room on the V2-Commercial desk (the lower crossbar is further back).

T-Frame style

The T-Frame Style centers all parts of the frame under the desktop, with equal space in the front and back. This style is typically utilized for conference tables or when a desk will be accessed from both sides. It's also useful when desk frame visual symmetry is preferred at the expense of accessory mounting space under the desktop.
